# **General Camera Model in Computer Vison**

Oct. 23th 2022 Shinichiro Sonoda

## 1. Pinhole Camera Model 1)

The following is an excerpt from the reference material 1) and some notation corrections.

In [1]: from IPython.display import Image Image ("./png/Pinhole\_camera1.png")

Out[1]:

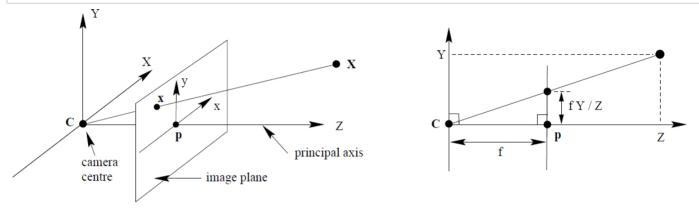

Figure 1. Pinhole camera geometry. The centre of projection is called the camera centre or the optical centre. The line from the camera centre perpendicular to the image plane is called the principal axis or principal ray. The point where the principal axis meets the image plane is called the principal point. The plane through the camera centre parallel to the image plane is called the principal plane of the camera. C is the camera centre and p the principal point. The camera centre is here placed at the coordinate origin [Hartley and Zisserman, 2003]<sup>2).</sup>

Let the centre of projection be the origin of a Euclidean coordinate system, and the plane Z=f, which is called the image plane or focal plane. Under pinhole camera model, a point in space with coordinates  $(X,Y,Z)^T$  is mapped to the point on the image plane  $(\frac{fX}{Z},\frac{fY}{Z},f)^T$  using triangles as shown in Figure 1

$$(X, Y, Z)^T \longrightarrow (\frac{fX}{Z}, \frac{fY}{Z})^T$$
 (1)

Central projection can simply expressed as a linear mapping between their homogeneous coordinates in terms of matrix multiplication by,

$$\begin{bmatrix} fX \\ fY \\ Z \end{bmatrix} = \begin{bmatrix} f & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$
 (2)

Principal point offset: In theory the origin of coordinates in the image plane assumed to be at the principal point. This may not be true in practice, hence, the Eq. (2) is express as,

$$\begin{bmatrix} fX + Zp_x \\ fY + Zp_y \\ Z \end{bmatrix} = \begin{bmatrix} f & 0 & p_x & 0 \\ 0 & f & p_y & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$
(3)

First matrix in the right side of Eq. (3) called camera calibration matrix, usually expressed by K. For added generality, the calibration matrix can be express as,

$$K = \begin{bmatrix} \alpha_x & s & p_x \\ 0 & \alpha_y & p_y \\ 0 & 0 & 1 \end{bmatrix}$$
 (4)

where s is referred to as the skew parameter which is zero for most of the cameras.  $f_x$  and  $f_y$  where  $\alpha_x = fm_x$  and  $\alpha_y = fm_y$  represent the focal length of the camera in terms of pixel dimensions in the x-axis and the y-axis respectively, and  $(p_x, p_y)$  is coordinate of the principal point.

$$\lambda \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} \alpha_x & 0 & p_x & 0 \\ 0 & \alpha_y & p_y & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$
 (5)

$$\mathbf{x} = \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \tag{6}$$

を画像のピクセル座標と定義する。

In [2]: Image("./png/Pinhole\_camera2.png")

Out[2]:

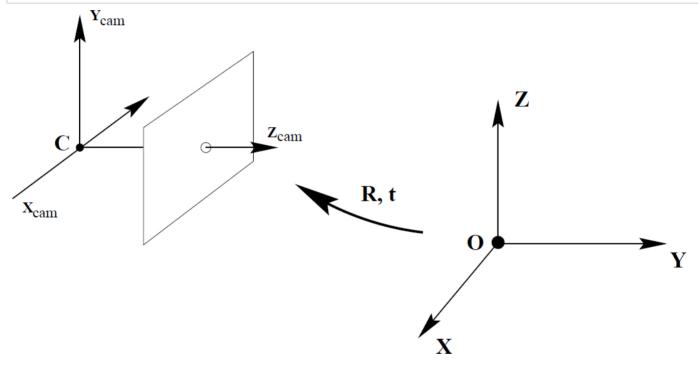

Figure 2: The Euclidean transformation between the world and camera coordinate frames [Hartley and Zisserman, 2003].

The camera coordinate and world coordinate frames are related by rotation and translation. As it is shown in Figure 2, if  $\mathbf{X} = (X, Y, Z, 1)^T$  is the coordinate of the point in the world coordinates, then  $\mathbf{X}_{cam}$  is transformed by,

$$\mathbf{X}_{cam} = \begin{bmatrix} R & t \end{bmatrix} \mathbf{X} \tag{7}$$

So that, the general pinhole camera matrix, P, can be represented by,

$$\mathbf{P} = \mathbf{K} \begin{bmatrix} \mathbf{R} & \mathbf{t} \end{bmatrix} = \begin{bmatrix} \alpha_x & 0 & p_x \\ 0 & \alpha_y & p_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} r_1 & r_2 & r_3 & t_1 \\ r_4 & r_5 & r_6 & t_2 \\ r_7 & r_8 & r_8 & t_3 \end{bmatrix}$$
(8)

よって

$$\lambda \mathbf{x} = \mathbf{K}\mathbf{R}\mathbf{X} + \mathbf{K}\mathbf{t}$$

$$= \mathbf{K} \begin{bmatrix} \mathbf{R} & \mathbf{t} \end{bmatrix} \mathbf{X}$$
(9)

Internal camera parameters, K, show the internal orientation of the camera and it is fixed.

**External parameters, R and t** show camera orientation and position to a world coordinate system.

回転行列**R**はロドリゲス行列式で記載できる。ロドリゲス行列については以下のURLを参照 <a href="https://w3e.kanazawa-it.ac.jp/math/physics/category/physical\_math/linear\_algebra/henkan-tex.cgi?">https://w3e.kanazawa-it.ac.jp/math/physics/category/physical\_math/linear\_algebra/henkan-tex.cgi?</a> <a href="https://w3e.kanazawa-it.ac.jp/math/physics/category/physical\_math/linear\_algebra/henkan-tex.cgi?">https://w3e.kanazawa-it.ac.jp/math/physics/category/physical\_math/linear\_algebra/henkan-tex.cgi?</a> <a href="https://wath/physics/category/physical\_math/linear\_algebra/rodrigues\_rotation\_formula.html">https://wath/physics/category/physical\_math/linear\_algebra/henkan-tex.cgi?</a> <a href="https://wath/physics/category/physical\_math/linear\_algebra/rodrigues\_rotation\_formula.html">https://wath/physics/category/physical\_math/linear\_algebra/henkan-tex.cgi?</a> <a href="https://wath/physics/category/physical\_math/linear\_algebra/rodrigues\_rotation\_formula.html">https://wath/physics/category/physical\_math/linear\_algebra/henkan-tex.cgi?</a> <a href="https://wath/physics/category/physical\_math/linear\_algebra/rodrigues\_rotation\_formula.html">https://wath/physics/category/physical\_math/linear\_algebra/rodrigues\_rotation\_formula.html</a>)

x軸回りの $\theta_x$ 回転させる行列を $\mathbf{R}_{\mathbf{x}}(\theta_x)$ 

y軸回りの $\theta_v$ 回転させる行列を $\mathbf{R}_{\mathbf{y}}(\theta_v)$ 

z軸回りの $\theta_z$ 回転させる行列を $\mathbf{R}_{\mathbf{v}}(\theta_{\mathbf{v}})$ 

とすると、 $\mathbf{R} = \mathbf{R}_{\mathbf{x}}(\theta_{x})\mathbf{R}_{\mathbf{y}}(\theta_{y})\mathbf{R}_{\mathbf{y}}(\theta_{y})$ と表すことができる。

### 2. QR分解<sup>3)4)</sup>

### カメラ行列Pからキャリブレーション行列K、回転行列R、並進ベクトルtを求める方法

$$\mathbf{P} = \begin{pmatrix} P_{11} & P_{12} & P_{13} & P_{14} \\ P_{21} & P_{22} & P_{23} & P_{24} \\ P_{31} & P_{32} & P_{33} & P_{34} \end{pmatrix}$$
(10)

とすると、

$$\begin{pmatrix} P_{11} & P_{12} & P_{13} \\ P_{21} & P_{22} & P_{23} \\ P_{31} & P_{32} & P_{33} \end{pmatrix} = \begin{pmatrix} \alpha_x & 0 & p_x \\ 0 & \alpha_y & p_y \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} r_{11} & r_{12} & r_{13} \\ r_{21} & r_{22} & r_{23} \\ r_{31} & r_{32} & r_{33} \end{pmatrix}$$
(11)

となる。

**K**行列は、三角行列になっている。

またR行列は回転行列であるので、直交正規行列となる。

このような行列積はQR分解でそれぞれの行列に分解することができる。

カメラ行列**P**がわかるとQR分解で**K**及び**R**が求まる。 求められた**K**を用いて以下の関係から**t**を求めることができる。

$$\begin{pmatrix} P_{14} \\ P_{24} \\ P_{34} \end{pmatrix} = \begin{pmatrix} \alpha_x & 0 & p_x \\ 0 & \alpha_y & p_y \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} t_1 \\ t_2 \\ t_3 \end{pmatrix}$$
(12)

$$\mathbf{t} = \mathbf{k}^{-1} \begin{pmatrix} P_{14} \\ P_{24} \\ P_{34} \end{pmatrix} \tag{13}$$

### 3. カメラ中心の求め方 3)

カメラ中心 $\mathbf{C}$ は、 $\mathbf{PC} = 0$ となるため、(9)式より  $\mathbf{KRC} + \mathbf{Kt} = 0$ となる。  $\mathbf{C} = -\mathbf{R}^T\mathbf{t}$  となる。

### 4. 点群からカメラ行列の推定(独自方法なので検証が必要)

 $\lambda \mathbf{x} = \mathbf{K}\mathbf{R}\mathbf{X} + \mathbf{K}\mathbf{t}$ より

 $\lambda \mathbf{x} - \mathbf{K}\mathbf{t} = \mathbf{K}\mathbf{R}\mathbf{X}$ となる。  $\mathbf{x}' = \lambda \mathbf{x} - \mathbf{K}\mathbf{t}$ とする。

複数の点群 $\mathbf{X}_1,\mathbf{X}_2,\mathbf{X}_3,\cdot\cdot\cdot,\mathbf{X}_n$  とすると、

$$\mathbf{M}_{X} = \begin{pmatrix} X_{11} & X_{12} & X_{13} & & & X_{1n} \\ X_{21} & X_{22} & X_{23} & \cdot \cdot \cdot \cdot & & X_{2n} \\ X_{31} & X_{32} & X_{33} & & & X_{3n} \end{pmatrix}$$
(14)

とする。 射影された点群 $\mathbf{x}_1^{'},\mathbf{x}_2^{'},\mathbf{x}_3^{'},\cdots,\mathbf{x}_n^{'}$  とすると、

$$\mathbf{M}_{x'} = \begin{pmatrix} x'_{11} & x'_{12} & x'_{13} & & x'_{1n} \\ x'_{21} & x'_{22} & x'_{23} & \cdot \cdot \cdot \cdot & x'_{2n} \\ x'_{31} & x'_{32} & x'_{33} & & x'_{3n} \end{pmatrix}$$
(15)

より、

$$\mathbf{M}_{x'} = \mathbf{KRM}_X \tag{16}$$

となる。  $\mathbf{M}_X$ の疑似逆行列を $\mathbf{M}_X^+$ とすると、

$$\mathbf{KR} = \mathbf{M}_{x'} \mathbf{M}_{X}^{+} \tag{17}$$

でKRを求めることができる。従って、tが既知ならばPを推定することができる。

同様に疑似逆行列を用いてtが未知の場合にPを推定することを試みたが、うまくいかなかった。理由はわかっていない。

## 5. テストプログラム<sup>3)</sup>

```
In [3]: from scipy import linalg
